# Resourcing the energy transition

Decom Futures – Jan 2021

**Dr Charlotte Stamper** *Energy infrastructure – sector manager* Zero Waste Scotland

zerowastescotland.org.uk

## **ABOUT US**

Zero Waste Scotland exists to lead Scotland to use products and resources responsibly, focusing on where we can have the greatest impact on climate change.

## **Renewables in Scotland**

Scotland's world-leading climate change targets include supplying 50%

of the energy for Scotland's heat, transport and electricity consumption from renewable sources by 2030

#### Electricity generated from renewable sources Scotland, 2000 - 2019 Onshore Offshore Wave **Bioenergy** Hvdro wind Wind and Tidal & waste 2000 4.972 GWh 4,202 GWh 2001 2002 5.099 GWh 2003 3.724 GWh 2004 5,832 GWh 2005 6,486 GWh 2006 6.956 GWh 2007 8.003 GWh 2008 9.058 GWh 2009 10.582 GWh 2010 9,419 GWh 2011 13,869 GWh 2012 14.667 GWh 2013 16.990 GWh 2014 19.045 GWh 2015 21,743 GWh 2016 19.476 GWh 2017 25.301 GWh 2018 26,865 GWh 2019 30.521 GWh

## Total final energy consumption by sector 2019 Transport 24.7% Heat Electricity 21.6%

Other

3.0%

## **Resourcing the transition**

The energy transition must be vast and rapid, and this requires a huge materials transformation.

The building of new energy infrastructure requires the deployment of millions of tonnes of metals, concrete and composites

This will be concurrent with the decommissioning of old assets through repowering and move away from fossil fuels

"...the vast majority of climate and carbon scenarios have paid little, if any, attention to the implications of the requirements for the materials necessary to 'feed' the carbonconstrained future"

World Bank, 2018

## The importance of resilience

**Guarding against global and local shocks** 

## The challenge

#### There are specific problems that need to be addressed:

## High carbon impact of **imported** raw materials

e.g., new infrastructure committing to using virgin steel from high carbon economies

## High carbon impact of **exported** raw materials

e.g., steel from decommissioning exported for recycling in blast furnaces overseas

Global demand for critical materials needed for new technologies Resilience of local economies against job losses in oil and gas

£

Trade tariff + carbon pricing impact on cost of raw materials for new infrastructure Limited economic benefits as supply chain for new infrastructure is focussed overseas

## The opportunity

### Which also represent opportunities:

## High carbon impact of **imported** raw materials

e.g., new infrastructure committing to using virgin steel from high carbon economies

## High carbon impact of **exported** raw materials

e.g., steel from decommissioning exported for recycling in blast furnaces overseas

0

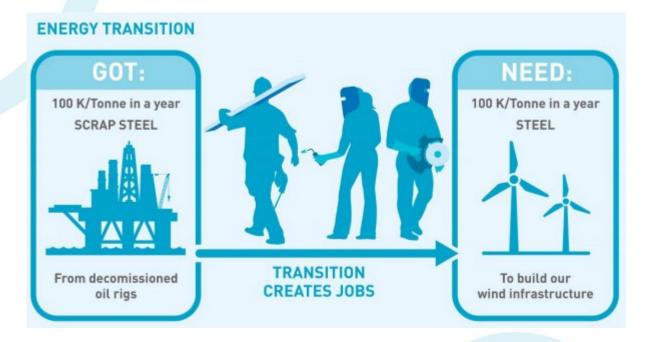

Global demand for critical materials needed for new technologies Resilience of local economies against job losses in oil and gas

£

Trade tariff + carbon pricing impact on cost of raw materials for new infrastructure Limited economic benefits as supply chain for new infrastructure is focussed overseas

## The role of decommissioning

"A circular economy approach to decommissioning, supported by a strong domestic reprocessing sector, can reduce emissions, create jobs, and generate economic prosperity"

How can we turn decommissioning from a final disposal point, to a system of regeneration?
